

# The Blunder

Samantha was tasked with calculating the average monthly salaries for all employees in the **EMPLOYEES** table, but did not realize her keyboard's **0** key was broken until after completing the calculation. She wants your help finding the difference between her miscalculation (using salaries with any zeroes removed), and the actual average salary.

Write a query calculating the amount of error (i.e.: *actual* — *miscalculated* average monthly salaries), and round it up to the next integer.

## Input Format

The **EMPLOYEES** table is described as follows:

Column	Type
<i>ID</i>	<i>Integer</i>
<i>Name</i>	<i>String</i>
<i>Salary</i>	<i>Integer</i>

**Note:** *Salary* is measured in dollars per month and its value is  $< 10^5$ .

## Sample Input

<i>ID</i>	<i>Name</i>	<i>Salary</i>
1	Kristeen	1420
2	Ashley	2006
3	Julia	2210
4	Maria	3000

## Sample Output

2061

## Explanation

The table below shows the salaries *without zeroes* as they were entered by Samantha:

<i>ID</i>	<i>Name</i>	<i>Salary</i>
1	Kristeen	142
2	Ashley	26
3	Julia	221
4	Maria	3

Samantha computes an average salary of **98.00**. The *actual* average salary is **2159.00**.

The resulting error between the two calculations is  $2159.00 - 98.00 = 2061.00$  which, when rounded to the next integer, is **2061**.
